A new study is claiming that the long-term consumption of palm oil may be linked to obesity in humans, which researchers link to Type II diabetes. An extensive new study of the effects of palm oil on the body is suggesting that the vegetable oil, that is commonly used in cooking and processed food, may cause obesity and Type II diabetes, according to a new study in the New England Journal of Medicine. The study, which was conducted at the University of South Carolina and published on April 5, provides the first long-term human trial on the effects of palm oil on the body. The study stated that palm oil may cause inflammation and the immune system, which can lead to the buildup of body fat and ultimately contribute to diabetes. The research, published in the New England Journal of Medicine, comes just days before a major food summit in London which is organised by the Healthy New York Foundation and The European Foundation for the Improvement of Living and Working Conditions, where world leaders and experts will be debating the impact of diets and obesity on the global economy. Palm oil is the most widely used vegetable oil in the world, and it is derived from the fruit of the oil palm tree, which has been in existence for at least 7,000 years. It is found in nearly all of the fried food and processed snack foods in Western markets and is used in baked goods, margarine, some sauces and condiments, and pet food. The vegetable oil has become an important part of the Western diet and it is now linked to the rise in obesity and diabetes. The World Health Organisation and the American Heart Association have classed the oil as a “nutritionally suspect” oil, saying that it is very high in saturated fats and has a low content of polyunsaturated fats. Many palm oil producers have started to place warnings on their products to warn consumers of the potential health problems that can come from a diet high in palm oil. Sari Poutanen, who led the research, stated that people who regularly eat fried food and other processed foods rich in palm oil are more likely to become obese and have a greater chance of developing diabetes. He said that in their findings, “we found that palm oil caused oxidative stress, inflammation and immune dysfunction. This in turn resulted in the harmful build-up of fatty tissue in the body.” “Palm oil is a widely consumed vegetable oil, and until
