Search Page 5 of 6. This page is used to build the initial answer set. We can find the number of subscribers and fans and the subject of each fan and We can find the name of one of the favorite fan subject based on the rank of the fan. We can find the name of the subscriber of the answer based on the reply rank and We can find the name of the owner of the question and answer by the reply rank. Having found the name of the owner, we can find the contact information (address, phone number, email address, etc.) for this owner by a simple SQL query. Before showing the possible question for each fan, we find the priority score of the corresponding fan. This project on the role of the Dorsal Nasal Wall in Controlling Nasal Septation is progressing with the support of NIOSH under the auspices of the NIOSH Grant funding. We have made progress in delineating the way the dorsal nasal wall develops. Preliminary results indicate that the ultimate cells have very different properties and characteristics than predicted. The cell behavior seems to suggest a mechanism for local remodeling of the cartilage. Further study is in progress to determine the growth pattern and genetic profile of the cells of the dorsal nasal wall. Left-sided atrial electrocardiographic repolarization changes. We sought to investigate the clinical relevance of differences in left-sided repolarization among various populations. A body surface system was used to record 12-lead (left-sided) electrocardiograms in 28 subjects. For comparison, data from a previous study by the same group on the same subjects were also obtained. Repolarization differences between leads X and Y (standing and supine positions, respectively) were compared in the 3 subject groups. Repolarization differences in lead X showed a consistent pattern: 1) There was a small decrease in the maximum repolarization level in the middle right side of the body surface tracing in the standing position compared with the supine position; 2) There was a substantial increase in the slope of the repolarization wave on the right side of the body surface tracing in the standing position compared with the supine position, from -0.09 ± 0.04 ms/m² to 0.19 ± 0.08 ms/m² (P c6a93da74d
